- 1 Intro, what's compilation
- Compiler phases
- The RISCV architecture in a nutshell
- One example

Credits

A large part of the compilation part of this intro course is inspired by the Compilation Course of JC Filliâtre at ENS Ulm who kindly offered the source code of his slides.

Most of the material is shared between the UCBL course "MIF08" (Compilation et Traduction de Programmes) and the ENS course "CAP" (Compilation et Analyse de Programme).

What's compilation?

Compilation toward the machine language

We immediately think of the translation of a high-level language (C,Java,OCaml) into the machine language of a processor (x86, PowerPC...)

Target Language

This aspect (compilation into assembly) will be presented in this course, but we will do more:

Compilation is not (only) code generation

A large number of compilation techniques are not linked to assembly code production.

Moreover, languages can be

- interpreted (Basic, COBOL, Ruby, Python, etc.)
- compiled into an intermediate language that will be interpreted (Java, OCaml, Scala, etc.)
- compiled into another high level language (or the same !)
- compiled "on the fly" (or just on time)

Compiler/ Interpreter

• A compiler translates a program P intro a program Q such that for all entry x, the output Q(x) is the same as P(x).

$$\forall P \exists Q \forall x...$$

• An interpreter is a program that, given a program P and an entry x, computes the output of P(x):

$$\forall P \ \forall x \ \exists s \dots$$

Compiler vs Interpreter

Or:

- The compiler makes a complex work once, to produce a code for whatever entry.
- An interpreter makes a simpler job, but on every entry.
- ▶ In general the code after compilation is more efficient.

Example

```
source —> lilypond —> PostScript file —> gs —> image

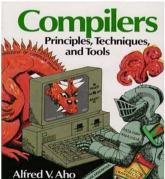

\chords { c2 c f2 c }
\new Staff \relative c' { \time 2/4 c4 c g'4 g a4 a g2 }
\new Lyrics \lyricmode { twin4 kle twin kle lit tle star2 }
```

Compiler Quality

Quality criteria?

- correctness
- efficiency of the generated code
- its own efficiency

"Optimizing compilers are so difficult to get right that we dare say that no optimizing compiler is completely error-free! Thus, the most important objective in writing a compiler is that it is correct."

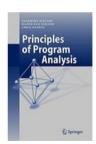

(Dragon Book, 2006)

Program Analysis

To prove:

- Correctness of compilers/optimisations phases.
- Correctness of programs: invariants

... also in this course!

The course

- Syntax Analysis: lexing, parsing, AST, types.
- Evaluators.
- Code generation and optimisations.
- Formal Semantics (many versions!)
- Language extensions.

Goal:

Become familiar with the mechanisms inside a compiler Understand how to reason about programming languages

The Lab

A <u>complete</u> compiler for the RISCV architecture!

 \Rightarrow Big guided programming project all along the semester

Support language: Python 3

Goal:

Become able to navigate a medium-sized programming project Understand the link between theory and implementation

Grading

- Three graded labs
- One homework
- One final exam

$$Note = \frac{exam + average(Lab3, Lab4, Lab5, homework)}{2}$$

Course Organization

Everything is on the webpage:

- Compiler phases
- The RISCV architecture in a nutshell
- One example

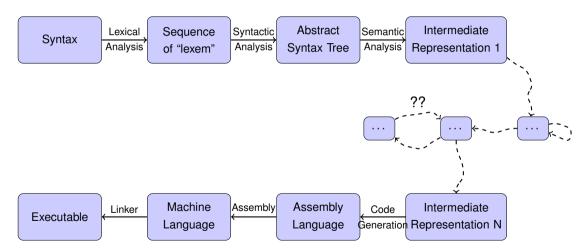

Compiler phases

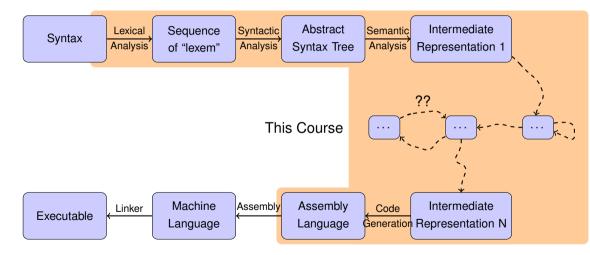

Usually, we distinguish two parts in the design of a compiler:

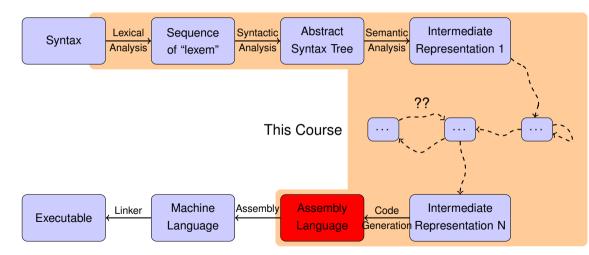

- an analysis phase:
 - recognizes the program to translate and its meaning.
 - raises errors (syntax, scope, types . . .)
- Then a synthesis phase:
 - produces a target file.
 - sometimes optimises.

NEXT:

assembly

Our target machine: RISCV

Excerpts from https://en.wikipedia.org/wiki/RISC-V

RISC-V (pronounced "risk-five") is an open-source hardware instruction set architecture (ISA) based on established reduced instruction set computer (RISC) principles. [...] RISC-V has a modular design, consisting of alternative base parts, with added optional extensions.

► We will use a subset of the RV64I Base Integer Instruction Set, 64-bit + some shortcuts.

RISCV ecosystem

- Versions of state-of-the-art compilers are available: riscv64-unknown-elf-gcc for us.
- ISA simulators are available: spike for us.

RISCV registers

- Memory is addressed as 8-bit bytes
- 64-bit words can be accessed with the load (ld) and store (sd) instructions.
- In the RV64I version, instructions are encoded on 32 (32 as well in the RV32I)
- 32 (64-bit) registers (x0, x1, ...), the first integer register is a zero register, and the rest is general purpose. Registers have symbolic names (sp, fp, ...) to implement standard conventions. Use only symbolic names when you write code
- In the base RV64I ISA, there are four core instruction formats (R/I/S/U).

RISCV ISA

We provide you an external document with a summary of the ISA.

Example : ADD instructions

- add rd, rs1, rs2, does rd <- rs1 + rs2.
 - → All operands are registers.
 - \rightarrow Example: "add t1, t2, t3" executes t1 <- t2 + t3.

- addi rd, rs1, imm, does rd <- rs + imm.
 - → The last operand is an immediate value (on xx bits) encoded in the instruction.
 - \rightarrow Example: "addi t1, t2, 5" executes t1 <- t2 + 5.

R or I-typed instructions

class	action	encoding
add rd, ri, rj (R)	$r_d \leftarrow r_i + r_j$	0000000 <rj(5bits)> <ri(5bits)> 000 <rd(5bits)> 0110011</rd(5bits)></ri(5bits)></rj(5bits)>
addi rd, ri, cte (I)	$r_d \leftarrow r_i + cte$	<pre><cte(12bits)> <ri(5bits)> 000 <rd(5bits) 0010011< pre=""></rd(5bits) 0010011<></ri(5bits)></cte(12bits)></pre>

Example: assemble addi t1, t2, 5

R or I-typed instructions

class	action	encoding
add rd, ri, rj (R)	$r_d \leftarrow r_i + r_j$	0000000 <rj(5bits)> <ri(5bits)> 000 <rd(5bits)> 0110011</rd(5bits)></ri(5bits)></rj(5bits)>
addi rd, ri, cte (I)	$r_d \leftarrow r_i + cte$	<pre><cte(12bits)> <ri(5bits)> 000 <rd(5bits) 0010011< pre=""></rd(5bits) 0010011<></ri(5bits)></cte(12bits)></pre>

Example: assemble addi t1, t2, 5 cte=5, ri=t2=x7, 000, rd=t1=x6, 0010011

R or I-typed instructions

class	action	encoding
add rd, ri, rj (R)	$r_d \leftarrow r_i + r_j$	0000000 <rj(5bits)> <ri(5bits)> 000 <rd(5bits)> 0110011</rd(5bits)></ri(5bits)></rj(5bits)>
addi rd, ri, cte (I)	$r_d \leftarrow r_i + cte$	<pre><cte(12bits)> <ri(5bits)> 000 <rd(5bits) 0010011< pre=""></rd(5bits) 0010011<></ri(5bits)></cte(12bits)></pre>

Example: assemble addi t1, t2, 5 cte=5, ri=t2=x7, 000, rd=t1=x6, 0010011 0000|0000|0101| 0011|1 000 |0011|0 001|0011

R or I-typed instructions

class	action	encoding
add rd, ri, rj (R)	$r_d \leftarrow r_i + r_j$	0000000 <rj(5bits)> <ri(5bits)> 000 <rd(5bits)> 0110011</rd(5bits)></ri(5bits)></rj(5bits)>
addi rd, ri, cte (I)	$r_d \leftarrow r_i + cte$	<pre><cte(12bits)> <ri(5bits)> 000 <rd(5bits) 0010011< pre=""></rd(5bits) 0010011<></ri(5bits)></cte(12bits)></pre>

Example: assemble addi t1, t2, 5 cte=5, ri=t2=x7, 000, rd=t1=x6, 0010011 0000|0000|0101| 0011|1 000 |0011|0 001|0011 0x00538313

RISCV: branching

Unconditional branching (jump and link):

• jal rd, c, does rd=PC+4; PC += c (focus on PC for the moment)

Test and branch (branch if lower than, etc.):

- blt rs1, rs2, c, does PC += c if rs1 < rs2
- ► Shortcuts: "j label" and "blt rs1, rs2, label"
- ► The label is assembled into the adequate offset of the jump.
- See the list of operators in riscv_isa.pdf

RISCV Memory accesses instructions 1/2

• Load from memory (64-bit **d**ouble word) $r_d \leftarrow Mem[r_s + of f]$:

```
1 ld rd, off(rs)
```

• Store to memory:

```
sd rs, off(rd)
```

Load effective address (shortcut)

```
₁la rd, label
```

See the ISA for more info.
